✓ Chromium plating of aluminum and its alloys. Ladugås
Zak, Jerry Ertich, and Konrad Schmidt. "J. Electroanal. Chem."
5, 7-11 (1958). Al and Al alloys may be plated in the
usual baths after a previous application of a protective Zn
or brass layer, which prevents the oxidn. of the cleaned sur-
face. A bath with the compn., Zn 90, NaOH 450, CuCN
7.5 g./l., is suitable. The protective layer is dissolved away
in the Cr bath before Cr plating. The end of the solu.
process is detd. polarographically. The contaminations
(Cu and Zn) introduced into the Cr bath by the dissolving of
the layer are of the order of 4 mg./sq. dm. of the surface to
be Cr plated, and they do not interfere. From C.E. 1958,

ORIG. PUB. : Prace Inst., mech., 1958, 6, No 23, 58-63

ABSTRACT : Presented is a brief review of lustrous copper plating methods. Electrolyte, having the following composition (in gr/l) is recommended: Cu - 70, KCN_{free} - 19, KOH - 15, Na₂CO₃ - 22, KONS - 4, sodium salt of 2 - isopropylbenzethenesulfonic acid - 0.1; temperature of the electrolyte of 70 - 75°, D_K = 4 - 5 a/dm², pH of 10 - 10.5; the anode surface must be 1.5 times larger than that of the cathode. For the obtaining of good quality lustrous plating, objects being plated are
xplating. Galvanic Cells.

The influence of ammoniated peat on yields of cabbage.
P. Majewski, A. Maksimow, and H. Szmidtówna. *Roczniki Nauk Rolniczych* 66, Ser. A, No. 1, 51-65 (1952). The influence of high raw peat with degree of decompr. of approx. 15% was neg. on crop yields of cabbage (var. Anagri). Low peats with degrees of decompr. of 50% (slightly decompd.) and 90% (highly decompd.) had no observable influence. Transitional peat with a degree of decompr. of 70% had a pos. influence. The action of ammoniated peat on the yields of cabbage depended on the kind of peat used. N absorbed from high and transitional peats acted almost as well as the N derived from $(\text{NH}_4)_2\text{SO}_4$. The action of N absorbed from both low peats was greater than that from $(\text{NH}_4)_2\text{SO}_4$. A definite correlation was found between crop yield and the amount of N absorbed. The N of raw peat, with the exception of the transitional peat, was found to be useless for the plants. Raw peat reacted unfavorably upon the absorption of N from $(\text{NH}_4)_2\text{SO}_4$. The utilization of N absorbed in high and transitional ammoniated peat was approx. the same as that of $(\text{NH}_4)_2\text{SO}_4$ in the presence of peat. The utilization was less than in the case of $(\text{NH}_4)_2\text{SO}_4$ alone. The N absorbed in ammoniated low peats was more readily utilized than that in $(\text{NH}_4)_2\text{SO}_4$ alone. All expts. were carried out in test pots on a sandy podzol deficient in N. The three combinations of peat used were raw peat, raw peat with 1.4 g. of N (per pot) in the form of $(\text{NH}_4)_2\text{SO}_4$, and ammoniated peat in such quantities that the amt. of absorbed N was equal to 1.4 g. of N per pot. TITLE: Proton bombardment damage in silicon

SOURCE: Physica status solidi, v. 8, no. 1, 1965, 105-114

TOPIC TAGS: proton bombarded silicon, silicon lattice parameter, silicon crystal structure, proton bombarded silicon structure, proton bombarded silicon lattice

ABSTRACT: The aim of this investigation was to determine the effect of proton irradiation on the lattice parameters and crystal structure of Si. A monocrystal silicon plate about 10 mm thick was grown by spin-pulling in the [111] direction by the Chokhral'skiy method. The plate was ground and polished parallel to the [111] plane to an accuracy of $\pm 0.5^\circ$. The back surface of the sample was water-cooled. The face of the plate was half covered by a copper plate; the other half was exposed to a beam of 6.5-Mev protons. The dose was about 1 to 2×10^{18} protons/cm². The x-ray photographs of the bombarded face show an increase of the lattice parameter ($\Delta a = + 3 \times 10^{-5}$ Å) and a

Card 1/2

tilt (1.7") and band of the atomic planes with an effect somewhat similar to a dislocation edge. The angles between the normals of the atomic planes were determined from the intensity of the diffracted x-rays as a function of the angle around the vertical axis. A measurable deformation of the lattice planes and change of their distances was observed. The angle of the normals in the bombarded and unbombarded part was greatest in the plane perpendicular to the boundary between them, and smallest in the plane parallel to the boundary. The lattice parameter increased as a result of irradiation. Some defects were produced in the diamond-type structure as indicated by a diffraction from the (222) planes, which is absent in a perfect silicon structure. Orig. art. has: 7 figures and 2 tables. TEXT: Information is given that in Poland in 1955-1960 the compilation of a map on the 1:25,000 scale was completed for the entire territory of Poland and the work was developed in compiling photoplans and maps on the 1:5,000 scale. This work will continue in 1961-1965, and a particular attention will be paid to speeding-up the processes of compiling and publishing the maps. The publishing of various maps, in the first place reference maps, maps of towns and railroads, and school maps, will be extended. The author considers the problems connected with organization of geodetic work, improving the qualifications of specialists, their training and organization of labor, introduction into practice of geodetic and cartographic works of the most modern technique and methods. ✓

TITLE: Technical progress in the state geodetic service

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 12, 1962, 5,
abstract 12G27 ("Przegl..geod.", 1962, v. 34, no. 7, 288 - 292,
Polish)

TEXT: This is the report of the chairman of the Poland Main Administra-
tion of Geodesy and Cartography at the 16th Congress of the Society of Polish
Geodesists, read on April 8, 1962. All geodetic works carried out on the terri-
tory of the country must be coordinated. In implementing this, geodetic bureaus
of regional and municipal people's councils play important role, since they
possess archives of cartographic-geodetic materials. Organizations of geodetic
service must utilize to the highest degree the results of already completed
surveys, which will reduce new field geodetic works. Introduction of aerial
photosurvey is the basis of technical progress in geodesy practice. Mechaniza-
tion of land registration is extended by employing computers. Conversion to the
reflex method of matrix manufacture and introduction of diffusion method of pre-
paring copies of geodetic materials are steps forward. Methods of speeded per-
Card 1/2

Technical progress in the state geodetic service

formance of data processing should be elaborated. Activities of the Research Institute of Geodesy and Cartography in Warsaw are of great importance for improving geodetic practice. At the present time, the Institute solves the problems important for both the state service and departmental geodetic services. The Bureau of technical and economic information of the Institute serves to all geodetic enterprises, independent of their departmental associations. Technical progress in geodetic practice calls for a permanent improvement of personnel. In this respect cooperation of the Main Administration of Geodesy and Cartography with the Society of Polish Geodesists is fruitful, as the latter already organized a scientific-technical conference on the problems of technical progress in geodesy and cartography.

SZMIELEW, Wanda

Borsuk, Karol i Szanielew, Wanda. Podstawy geometrii. [The foundations of geometry.] Państwowe Wydawnictwo Naukowe, Warszawa, 1955. 363 pp. zł. 25.00.

This book deviates from other works with the same title both in content and in the extent to which details often omitted in other books are carried out.

It begins with an introduction on the history of the subject and on the very elements of point-set topology. The first four chapters are concerned with absolute geometry, in particular chapter I (pp. 23-74) with the axioms of incidence and order. As an example of a topic usually omitted we mention the topology of the plane obtained by defining the interiors of triangles as neighborhoods. A theorem like the following is at this stage not quite trivial: If a_1, a_2, a_3, a_4 are the vertices of a convex quadrangle and p is the intersection of its diagonals, then a_i has a neighborhood U_i such that for $a'_i \in U_i$ the quadrangle $a'_1 a'_2 a'_3 a'_4$ is convex and has its intersection of the diagonals in a preassigned neighborhood of p . Chapter II (pp. 74-112) treats the axioms of congruence. In Chapter III (pp. 113-158) we find the

2/2

SANDBERK

continuity axioms, Legendre's theorems on the angle sums of triangles, and a proof that the space is now metric and homeomorphic to E^2 or E^3 . Chapter IV (pp. 159-200) discusses models of absolute geometry and its non-categoricalness. Chapter V (pp. 201-213) outlines Euclidean geometry, whereas Chapter VI (pp. 214-273) treats hyperbolic geometry in great detail including the derivation of many of the more complicated formulae. Chapter VII (pp. 274-314) gives the foundations of plane and spatial projective geometry without continuity. The final Chapter VIII (pp. 315-346) deals with the continuity axioms of projective geometry and ends with a curiously detailed analysis of Hilbert's example for a non-Desargueian geometry. A detailed index follows.

An English edition of this book might well be an answer to the problem of how to acquaint young students with exact reasoning, presenting at the same time a coherent course.

TITLE: Modelling of chemical reactors.¹ 31
B
SOURCE: Magyar kemial folyoirat, no. 5, 1966, 219-224
TOPIC TAGS: chemical reactor, transport theory, differential equation system
ABSTRACT: [Authors' Hungarian summary] Following a brief discussion of the fundamental principles of the transport theory, the applicability of the theory of similitude in the physical modelling of reactors for the chemical industry is examined. The system of similitude invariants is derived from the differential equation-system set up with averaged (that is: measurable) quantities which describe the transport processes occurring in turbulent flows. It is demonstrated that, in the case of a quasi-homogeneous model, in systems which involve boiling, complete similitude can not be achieved and the presence of a partial (approximating) similitude can, at best, be determined afterwards (that is: following the physical realization of the systems). Analiza wpływu czasu trwania wstępnej czynności przejęcia na
wynik testu. Statyst. No 3 (1951), s. 326-336, I 1625.

In analysing job methods in tuberculosis control clinics it has been found that the key operational position from a productional point of view is the case transfer. An investigation of one of the operations carried out by the same number of persons showed the correlation between output and feed stand is described as indicating that the time of preliminary training is 10 seconds. It has been found that the efficiency of the case transfer team should be increased. More commencing operators in hospitals, especially the study of the following considerations, will help to increase efficiency. The absolute efficiency is 100%.

Alternative 2 is a different technique of higher feed speed which cuts down between legs, permitting smaller output increments.

„Badania nad wydajnością materiałową drewna bukowego”. Sylwan. No. 5, 1984, pp. 408–418, 9 tabs.

A description of experimental sawing of a consignment of beech raw material — first quality 7.1%, second quality 30.1%, third quality 62.8% — to obtain data, which can be compared with practical data, concerning qualitative and quantitative output. At a quantitative output of 76%, 15.3% of the total sawn lumber could be used for furniture laths. The output of laths in relation to the raw material was 38%. The experiment shows that lower quantity raw material could also be utilized for furniture laths, subject to proper sorting.

Title: Concrete Prepared by the Addition of Sulfite Liquor

Original

Periodical: Mater. budowl., 1956, Vol 11, No 6, 188-189; Polish

Abstract: The addition of sulfite-cellulose liquor to concrete increases its plasticity and improves the adhesion to the reinforcing steel. The hydrophilic properties of the concrete are inhibited, its setting and hardening are slowed down, shrinkage is reduced, water resistance is improved and the bulk density is decreased. Recommendations are made on the method of using sulfite liquor in concrete production.

52. Dimensions of vaulted slabs mounted between arcs,
by K. Szabadits. (*Jp. és építészeti* -- Building
Architecture -- Vol. II, No. 4, pp. 250--252, April, 1950)

This method of calculation is expected to supersede
the old fashioned theory of regarding slabs as continuous
plates. Calculations made on the basis of the old theory
resulted in dimensions that proved too large from an
economic point of view. The new theory leads to consider-
able savings of material by presenting the vaulted slabs
as fixed.

TITLE: Numerical investigation of membrane shells with rectangular plan

SOURCE: Academia scientiarum hungaricae. Acta technica, v. 50, 1965, 371-376

TOPIC TAGS: shell structure, shell theory

ABSTRACT: The numerical investigation of membranes with rectangular plan includes the determination of the grid values for a grid function that satisfies a non-homogeneous potential equation. This paper presents a reciprocity theorem and shows that with its aid and with the known relations between the ordinates of the grid function the solution for any inner point can be determined from the solution corresponding to a loaded point near the boundary. The application of the method was illustrated by a numerical example. Orig. art. has: 6 figures and 5 formulas. [Based on author's Eng. abst.] [JPRS]

TITLE: Numerical study of a plate clamped on two opposite sides and freely supported on the two other sides

76

SOURCE: Academia scientiarum hungaricae. Acta technica, v. 53, no. 3-4, 1966,
379-387

TOPIC TAGS: thin plate, iteration

ABSTRACT: The method described is based on the generalization of the Goursat theorem to lattice functions. By applying this theorem and summarizing two known solutions, the solution for a plate rigidly fixed on two sides and freely supported on the two other sides can be derived. The conditions of constraint for the sides opposite to the fixed ones can be satisfied by a rapidly converging iteration of the summation of known solutions. Orig. art. has: 2 figures, 1 formula and 8 tables. [Based on author's Eng. abst.] [JPRS: 36,645]
